

Experience Oriented Architecture (EOA):

Making Experience Core Metric
for Agentic Systems Template

- It's critical to define and decode **experience**. Every major tech platform positions EXPERIENCE as a strategic differentiator, but have we defined it in the **business** context?
- Enterprises deploy agents to deliver work for diverse stakeholders, including end customers. This mandates ownership and accountability.

This is a defining moment: Experiences are persona-linked, yet the persona's activity-set will change as processes evolve. Hence the experience must remain consistent even when tasks and activities do not.

Our Proposition:

Design agents with experience as the pivot and with the intelligence to recognize changes in persona activities without altering the intended experience. Agents should determine the next-best substitute action to minimize variation in the user's experience.

The next step is to establish a clear point zero—your MVE (Minimum Viable Experience)—that specifies the non-negotiable qualities of the experience from day one.

If asked what experience comprises, we use three core attributes:

These attributes should be articulated via journey maps, design principles, and operational guardrails. Transition points (often referred to as friction points) and delivery moments must include mechanisms to capture this data consistently.

This may sound theoretical, but it will be a **foundational differentiator** and an **enterprise-level metric**. We have previously outlined an **Experience-Oriented Architecture (EOA)** that extends beyond SOA/BOA to establish a consistent, cross-touchpoint experience—the essential foundation for agentic systems at scale.

Experience is not converting into metrics – CST is improving, but the cost is not getting justified in business benefits

- Return of Experience (ROE) – Reduced customer churn, increase in Customer referrals

Use case: Telecom Industry:

Use cases to follow – in the coming posts (speed of response, contextual dynamic emotion response (understand the changing emotions of the customer 2. Responding to the emotion of the customer)

Understanding the level of conversation/transaction and tuning the response accordingly (Developing Agent EQ)

Emotion reflection – Usually, it is human characteristics to emulate human behaviour – an irate customer leads to an irate CSR. However, this should not be infused into the model as there have been instances when an irate customer is talking to a bot, the responses of the bot have transformed into an unpleasant response.

Machines can be trained for an opposite behaviour in terms of these responses (and rather calm down the user in the most effective manner)

EXPECTATIONS – “what was promised”

- Outcomes & success criteria, SLAs & SLOs
- Pricing, TCO/ROI assumptions, procurement terms
- Risk, security, compliance, data governance

Performance

EXPERIENCE

Trust

- Interface copy & micro-interactions
- Response & resolution times
- reliability/performance footprints
- Agent tone & play-books

Action

- Confidence vs. uncertainty – perceived control
- Trust & fairness – safety & privacy comfort
- Effort & frustration – anxiety vs. reassurance
- Delight & pride in progress – relief after recovery

EMOTION – “what is felt”

EXPRESSIONS – “what is shown & done”

Trust is human psychometric response that has a natural inclination and repeat response

Reimagine What's Possible with DIGITALFABRIC® PROSIGHT™

Empower your enterprise to thrive in a digital-first world with bold thinking, purpose-driven design, and cutting-edge technology. At DIGITALFABRIC®, we blend strategy, cloud, data, and automation to architect future-ready solutions that deliver real impact. Partner with us to unlock agility, enhance customer experience, and accelerate business transformation at scale and with speed.
